

# LAN Communication Test

## 1.) uses of Ping Command in Network:

- To check the network connectivity
- To test and measure latency
- Helps in detect packet losses and delay
- To troubleshoot network problems.
- PING - "Packet Internet Groper"

## 2.) Netbios protocol:

This is mainly used for communication between computers on a local network, rather than using IP. We can check the reachability using system names and can share resources using the system names.

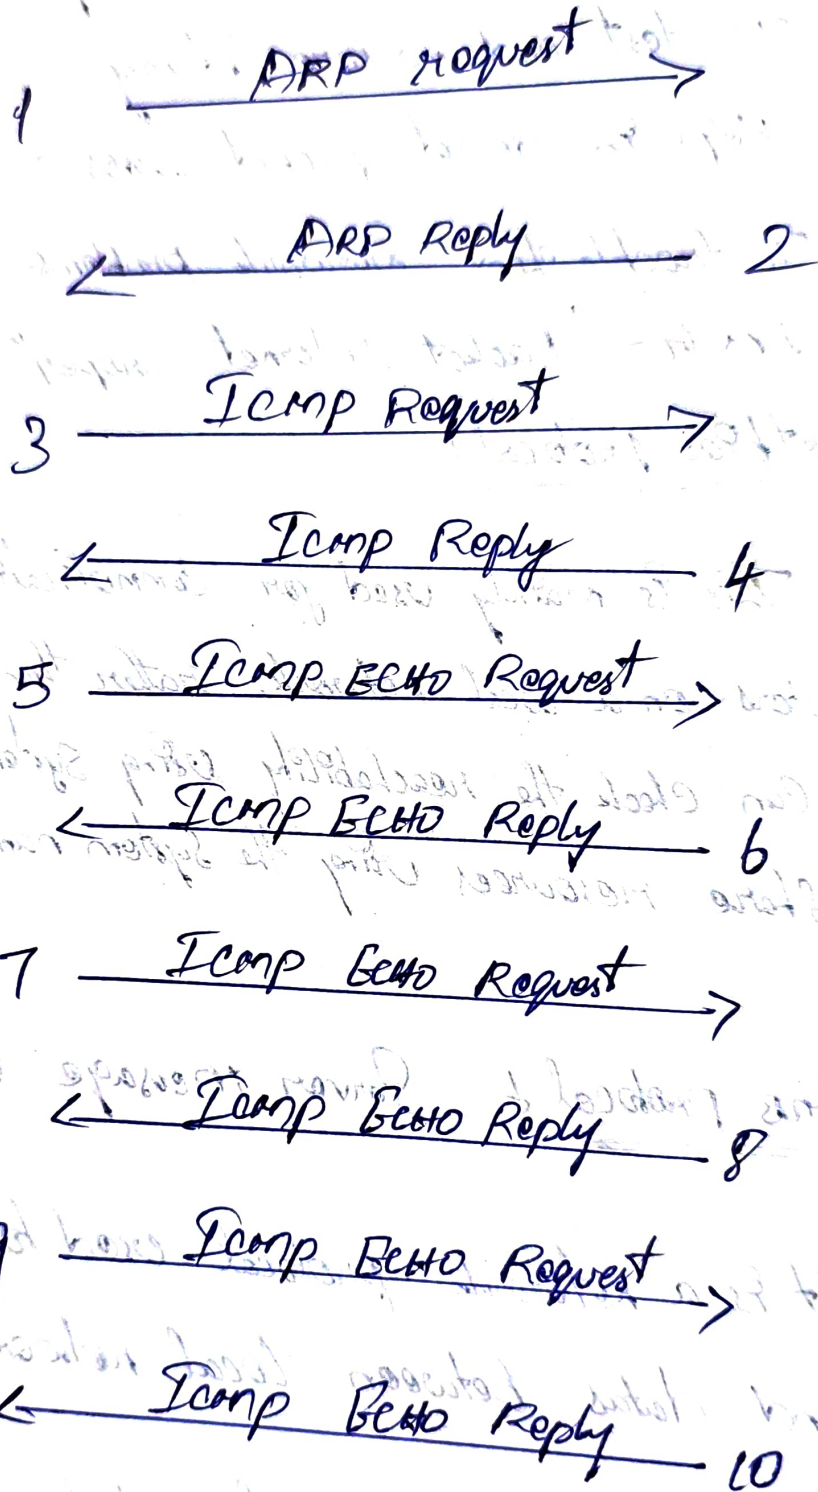

## 3.) SMB protocol & Server message Block

It is a network protocol used to share files and data between local network computers.

It handles the communication between two PCs to read and write the shared files.

4. Ping process from

50.0.0.10  $\longleftrightarrow$  50.0.0.20  
PC<sub>1</sub> PC<sub>2</sub>

If Reply received like this destination is reachable and if there is no delay - low latency no issue at network.
